

Reasons to use Heat Reflective Coatings

Reprinted; ArticleRICH
By Nathan Pershner

Warehouses and large commercial buildings all have one thing in common – it can cost a lot of money to run them. However these types of buildings can all benefit from using heat reflective coatings on their roofs, particularly in countries where the temperature can get very high at certain times of the day or year. Many owners of buildings that have a metal roof will complain that their cooling costs soar during the warmer months and their heating costs do the same in the colder months. To keep these buildings cool in the summer and warm in the winter many owners are now turning to heat reflective coatings which can work very well. However heat reflective coatings do have many advantages over simply turning up the air conditioning (or heating, in winter), which include:

- Heat reflective coatings are usually made from paint, although there are heat reflective membranes which can be used. Paint is obviously easy to apply and does not take too long to dry, making it ideal for use on a commercial metal roof.
- Heat reflective roof paint will last around fifteen years before it needs another application, which makes it one of the best types of coatings to use. Obviously, anyone interested in using heat reflective coatings will want to choose the coating that will last the longest and paint is the clear choice for a roof.
- Heat reflective coatings will work to reduce the cooling costs for the roof they are used on. Even a sheet metal roof can benefit from such a coating and as a result it is very common to see a warehouse with heat reflecting paint on its roof. Often people make the mistake of thinking that a metal roof would not benefit from heat reflective metal roof paint, but this is not the case.
- In addition to being used to keep buildings cool it is also possible to use heat reflective insulation paint to insulate a building in cold weather. This can make all the difference when it comes to the heating costs for the building and as a result more and more business owners are turning to this type of insulation to keep costs low.
- Heat reflective roof paint coatings can be obtained very easily and there are companies who specialise in providing this as a service. So anyone business owner who would like to reduce the operating costs of their building can have heat reflective coatings applied quickly and with the minimum of fuss.

Energy Seal Coatings

Acrylic Coatings for Roof and Wall Applications

- There is no risk to using heat reflective coatings on your building, so there is no cause for concern when thinking about having such a coating applied.

- As soon as heat reflective coatings have been applied to a roof and left to dry they will start to work.

The reasons to use heat reflective coatings all lead towards one thing, which is saving money and all business owners will be interested in that. So if you don't have your roof protected and your business is in a hot country, maybe you should.
